Cleanup process. It's a top priority for the selection committee. It's graphically depicted in the process flowchart. The alternative that had been leading up to it is the selection committee. The preferred alternative and the clearly native involved capping the landfill remediation technology input and how and when key decisions would have been made. The broad support for the project is quite turnaround from the project. I also prepared a glossary for the community members who had been using acronyms. And became confusing. It's mounting down EPA officials what number of federal and state agency were threatening the officials who were involved, developed support from the governor project "Who's Who" to help get the site removed community members understand the person's role. EPA has touted this project to expand its Mongolian and most successful membership in the community. CAG facilitates in its history. A representative of the group previously presented to the community group. I then coached the West Valley Demonstration Project participants in Task force how to participate in discussions with EPA. The Waste Project is located in New York. It waste storage facility system in New York. The Department of Energy and work community members through the State of New York rare cleanup and containment of radioactive waste left behind after abandonment. It worked on commercial nuclear reprocessing plant in 1980. over the course of many years. After two years, the project, the West Valley Citizens Force (WVCTF) had become next frustrated and ineffectual. I facilitated some of the Elizabeth Mine Community Advisory Group by intervening and helping the close to the specific issues work with NYSDA and come effectively. The project members often with the Native League, interviewed as monolithic; I've found it stakeholders helped plan meetings that helped CT come a project role.

much more productive presentations were clear, and the organization that works more understandable to their play and audio smoothly than the DOE and the agency that money was used it had in the past.

Mill River Cleanup

The remediation of lead contaminated sediment in the Mill River, Connecticut had been a high priority of the Connecticut Department of Energy and Environmental Protection (DEEP) for many years. The cleanup design and use of performance standards was essential to their agreement.

The cleanup was started due to extreme levels of sediment.

The sediment remediation and verification sampling was completed very quickly by the community activists few months ago. In addition to the very strict community group, there is distrust among the project partners involved.

In addition to high levels of sediment, the Mill River Sediment Remediation success involved significant and complex technical issues.

For More Information

disagreed regarding the best approach for sediment removal. For more information projects, and examples of fact sheets people needed to understand road maps that have issues and the cleanup options available, please see me, come to a presentation.

www.adamantaccord.com

And as if the project didn't already face sufficient challenges, there were a number of parties with very challenging priorities. They included another who liked intent on obstructing progress of the project. The facilitation discussions that resulted in agreement between the design team took less than 6 months. Adamant Accord has the community dialogue over the meetings with DEEP, town officials, and community members that conducted the project team hopes respect. Because the project wrap up meeting number of technical issues delayed until 2016.

worked very closely with technical experts to measure their approach.
